

Geoshore

Dikes protecting the shore from erosion are mainly made of natural riprap. At Seacure we design, size and install **innovative** dikes with gabion, that are as **efficient** as traditional methods, with numerous **ecological and economical advantages**.

HOW DOES IT WORK?

Ripraps are held by a metal structure protected from corrosion with **GEOCORAIL** process.

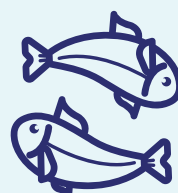

HIGHLIGHTS

- Cut of the rockfills size
- Reduction of the physical footprint
- Drastic decrease of the carbon footprint
- Possible use of recycled material
- Technical solution designed in collaboration with the CEREMA, under the Environment Ministry

OBJECTIVE

- Construction works instead of ripraps
- Creation of huge artificial reefs
